

Manufacturer Reduces Waste and Maintenance while Improving Consistency

CUSTOMER

Manufacturer Of Air-Powered Blast Equipment

GRACO EQUIPMENT

ProMix 2KS and ProMix 2KE

CHALLENGE

The world's largest manufacturer of air-powered blast equipment used to clean, deburr, shot peen, or remove coatings from surfaces has gained a reputation for high quality and durability of their product line. Always looking to improve on their current standards, they recently made a company wide mandate to upgrade the finishing material used on their equipment from a 1K primer to a tougher 2K-epoxy primer. In the past, they utilized Graco Triton pumps; pressure pots and AirPro Guns to spray, but with an upgrade in material came a need to upgrade the finishing equipment as well.

They runs a high volume line, easily using 50 gallons a week and were aware of the problems with waste and consistency associated with hand mixing. So they knew a mix-on-demand system would be best suited for their situation and they began comparing product offerings on the market.

SOLUTION

After consultation with their trusted local distributor, and consideration of other competitor's offerings, The manufacturer decided to install two ProMix 2KS systems and one ProMix 2KE. They had established

themselves as a proven quality brand, and wanted to buy equipment from a company that had similar standards and values.

RESULTS

As expected, the installation of the three pieces of equipment ran seamless, with very little slowing in production. The waste levels have remained low, and there were no maintenance reports in the first year. This specific instance has proven to be an overall win for the 2KS and the 2KE, but most importantly for manufacturer as well.
