Operation Manual

FIXED RATIO, HIGH CAPACITY

SuperCat™ Proportioner Package

5000 psi (34 MPa, 345 bar) Maximum Working Fluid Pressure
100 psi (0.7 MPa, 7 bar) Maximum Working Air Pressure

See instruction manual 308803 or 308925 for installation, troubleshooting, service, and parts information.

GRACO INC. P.O. BOX 1441 MINNEAPOLIS, MN 55440-1441
©COPYRIGHT 1999, GRACO INC.
Graco Inc. is registered to I.S. EN ISO 9001
INJECTION HAZARD
Spray from the gun, hose leaks, or ruptured components can inject fluid into your body and cause extremely serious injury, including the need for amputation. Splashing fluid in the eyes or on the skin can also cause serious injury.

- Fluid injected into the skin might look like just a cut, but it is a serious injury. Get immediate medical attention.
- Point the gun away from yourself or anyone else.
- Do not put your hand or fingers over the spray tip.
- Do not stop or deflect leaks with your hand, body, glove or rag.
- Do not “blow back” fluid; this is not an air spray system.
- Do not remove the spray gun trigger guard.
- Lock the gun trigger safety when you stop spraying.

FIRE, EXPLOSION, AND ELECTRIC SHOCK HAZARD
Improper grounding, poor ventilation, open flames, or sparks can cause fire, explosion, electric shock or other serious injury.

- Ground the equipment and the object being sprayed. See Ground the Equipment in manual 308803 or 308925.
- All electrical wiring must be done by trained and qualified personnel and comply with all local codes and regulations.
- If there is any static sparking while using the equipment, stop spraying immediately. Identify and correct the problem.
- Provide fresh air ventilation to avoid the buildup of flammable fumes.
- Do not smoke or introduce any sources of fire or spark within the spray area.
- Keep the spray area free of debris, including solvent, rags, and gasoline.

TOXIC FLUID HAZARD
Hazardous fluid or toxic fumes can cause serious injury or death if splashed in the eyes or on the skin, inhaled, or swallowed.

- Know the specific hazards of the fluid you are using.
- Wear protective eyewear, gloves, clothing and respirator as recommended by the fluid and solvent manufacturer.

EQUIPMENT MISUSE HAZARD
Equipment misuse can cause the equipment to rupture or malfunction and result in serious injury.

- This equipment is for professional use only.
- Read all instruction manuals, tags, and labels before operating the equipment.
- Use the equipment only for its intended purpose. If you are uncertain about usage, call your Graco distributor.
- Do not alter or modify the equipment. Use only genuine Graco parts and accessories.
- Check equipment daily. Repair or replace worn or damaged parts immediately. Do not mend or repair any part of the hose assembly. If the hose is damaged, replace immediately.
- Use only Graco approved hoses. Do not remove hose spring guards.
- Do not exceed the maximum working pressure of the lowest rated system component. This equipment has a 3000 psi (21 MPa, 210 bar) maximum working pressure at 100 psi (0.7 MPa, 7 bar) maximum incoming air pressure.
- Never operate the pump without the automatic pressure relief valves installed. These valves relieve fluid pressure through a drain port at the bottom of the valve if the maximum working pressure is exceeded.
- Tighten all fluid connections before operating the equipment.
- Do not lift the equipment by a pump air motor lift ring or the frame. See manual 308803 or 308925 to lift the equipment correctly.
- Route the hoses away from the traffic areas, sharp edges, moving parts, and hot surfaces.
- Use fluids and solvents that are compatible with the equipment wetted parts. See the Technical Data section of all the equipment manuals. Read the fluid and solvent manufacturer’s warnings.
- Comply with all applicable local, state and national safety regulations.

MOVING PARTS HAZARD
Moving parts, such as the air motor piston, can pinch or amputate fingers.

- Do not operate the equipment with the air motor plates or guards removed.
- Keep your body and tools clear of any moving parts when starting or operating the equipment.
NOTE: If the proportioner will not be used for a period that exceeds the work lifetime, be sure to follow the Daily Shutdown/Mix Material Flush procedure.

1. Lock the spray gun trigger safety.
2. Press the keypad mode key to change to manual mode.
3. Shut off the air regulators for the Premier proportioning pump and the feed pumps if installed.
4. Unlock the spray gun trigger safety.
5. Hold a metal part of the spray gun firmly to the side of a grounded metal pail, and trigger the gun to relieve pressure.
6. Lock the spray gun trigger safety.
7. Open the fluid drain valves, having a container ready to catch the drainage. Close the valves.
8. If you suspect that the spray tip or hose is completely clogged, or that the pressure has not been fully relieved after following the steps above, very slowly loosen the tip guard retaining nut or hose end coupling and relieve pressure gradually, then loosen completely. Now clear the tip or hose.

Pressure Relief Procedure/ Safety

**WARNING**

**INJECTION HAZARD**

The system pressure must be manually relieved to prevent the system from starting or spraying accidentally. Fluid under high pressure can be injected through the skin and cause serious injury. To reduce the risk of an injury from injection, uplifting fluid, or moving parts, follow the Pressure Relief Procedure if the spray tip clogs and whenever you:

- are instructed to relieve the pressure.
- check or service any of the system equipment.
- stop spraying.
- or install or clean the spray tip.

NOTE: If the proportioner will not be used for a period that exceeds the work lifetime, be sure to follow the Daily Shutdown/Mix Material Flush procedure.

1. Lock the spray gun trigger safety.
2. Press the keypad mode key to change to manual mode.
3. Shut off the air regulators for the Premier proportioning pump and the feed pumps if installed.
4. Unlock the spray gun trigger safety.
5. Hold a metal part of the spray gun firmly to the side of a grounded metal pail, and trigger the gun to relieve pressure.
6. Lock the spray gun trigger safety.
7. Open the fluid drain valves, having a container ready to catch the drainage. Close the valves.
8. If you suspect that the spray tip or hose is completely clogged, or that the pressure has not been fully relieved after following the steps above, very slowly loosen the tip guard retaining nut or hose end coupling and relieve pressure gradually, then loosen completely. Now clear the tip or hose.

Pressure Relief Procedure/ Safety

**Safety Tips**

**Warning Symbol**

This symbol alerts you to the possibility of serious injury or death if you do not follow the instructions.

This symbol alerts you to the possibility of fire, explosion, or electric shock if you do not ground the gun to a grounded container while performing the instructions.

This symbol alerts you to possibility of a fluid injection injury if you do not follow the instructions.

This symbol alerts you to possibility of fire, explosion, or electric shock if you do not follow the instructions.

This symbol alerts you to possibility of eye injury. Wear protective eye wear to avoid injury.

**Waste Container Safety**

Make sure a grounded metal waste container is under each fluid drain valve and the fluid tubes are secured into the containers.

Fluid emitted from the automatic pressure relief valves may be at high pressures. Make sure the container can contain a sudden spurt of pressurized fluid.

**Grounding the Gun**

When instructed to "ground the gun" in the following procedures, hold a metal part of the spray gun firmly to the side of a grounded metal pail while triggering the gun into the pail.
Observe the Work Life Time
If the work life time is exceeded, flush the mixed fluid out of the mixer, gun fluid line and gun before it hardens. Flush the complete system when necessary to prevent the fluids from hardening in the equipment.

Stop Key
Press the Stop Key to immediately shut down functions run by the controller or to turn off an alarm. To shut the entire system down, close the air supply valve to the system.

If a Pump Runs Dry
Press the Stop Key. Refill the container, and prime the system.

If an Alarm Occurs in Automatic Mode
To help diagnose the cause of the alarm, note which keypad and system schematic panel lights are on. See Alarms section. Press the Stop Key to turn off the alarm. If the material work life time may be exceeded during troubleshooting, flush out the mixed material. After correcting the cause of the alarm, prime and load the system with material to continue spraying.

General Operation

Operating Tips
Changing Operating Modes
The system will start up in manual mode. The schematic lights will come on to indicate the status of the system. In manual mode the mode key light will be off. Press the mode key to change to spray mode. In spray mode, the mode key light will be green.

Operating Feed Pumps in Manual Mode
If feed pumps are installed, turn them on by pressing the feed pump keys (PK) and gradually turning up the feed pump air regulators. The feed pumps turn off when the fluid reaches the full level sensor or when two minutes have elapsed. To manually turn off the feed pumps when they are running, press the feed pump keys again.

NOTE: The feed pump lights are green while the feed pumps run. The full level sensor lights are green when the sensor detects fluid.

Operating Premier Pump in Manual Mode
Turn on the Premier pump by pressing the Premier pump key (PK). Turn up the Premier pump air regulator pressure gradually until the pump is running slowly (about 1 cycle every 4 - 6 seconds). Use the lowest pressure setting where pump stroke runs smoothly, typically 500 psi (3.4 MPa, 34 bar). Release the Premier pump key to turn off the pump.

Operating the Solvent Pump in Manual Mode
Turn on the solvent pump by pressing the solvent pump key (SK) and gradually turning up the solvent pump air regulator. The solvent pump turns off when the solvent supplied reaches the preset amount. To manually turn off the solvent pump when it is running, press the solvent pump key (SK).

NOTE: The default solvent pump setting is 2 gallons (7.57 liters) of solvent.

CAUTION! Solvent pump will not automatically shut off when the full level is reached. Monitor the fill cycle to avoid overflow. Press the solvent key to stop the pump.
1. Completely flush the system.
2. Open both reservoir ball valves (56).
3. Set the mode key (MK) to Manual Mode.
4. Set the system regulators and valves.

   **Regulators:**
   - Premier Pump
   - Solvent Pump 0 Air Pressure
   - Feed Pump A 0 Air Pressure
   - Feed Pump B A0 Air Pressure

   **Valves:**
   - Fluid Drain Valves
   - Mix Manifold Valves
   - Solvent Valves
   - Recirculation Valves
   - Solvent Supply Valves
   - Fluid Flow Control Valves
   - Flow Direction Valves: Flow to reservoir

5. Fill the reservoirs with material.
   - Manually: Pour component A into reservoir A and component B into reservoir B.
   - If using feed pumps:
     a. Install full containers of component A and B at the feed pumps.
     b. Open the feed pump air supply valves.

6. Adjust the agitator (53) air control valve (N) to agitate the material in the reservoirs.

7. Hold down the Premier pump key (PK) and turn up the pump air regulator (C) pressure until the pump is running slowly.
8. Operate the Premier pump until all air and/or solvent is purged. Both component A and B should flow consistently out of the fluid drain valves (204).
9. Close the fluid drain valves (204).
1. Make sure the system is primed and the pressure has been relieved. Pressure Relief Procedure in General Operation, then install the gun tip guard, spray tip, and gasket.

2. Open the main air supply valve (T21).

3. If heaters are used, see Recirculating material section before proceeding.

4. Set the mode key (MK) to Spray Mode.

5. Set the system regulators and valves.

   - Regulators:
     - Premier Pump
     - Solvent Pump
     - Feed Pump A
     - Feed Pump B

   - Valves:
     - Fluid Drain Valves
     - Solvent Valves
     - Mix Manifold Valves
     - Recirculation Valves
     - Solvent Supply Valves
     - Fluid Flow Control Valves
     - Flow Direction Valves: Flow to beakers.

6. If feed pumps are used, adjust the feed pump air regulators (E, F) to the pressure necessary to supply fluid to the reservoirs.

7. Adjust the agitator (53) air control valve (N) to agitate the material in the reservoirs.

8. Ground the gun to a grounded metal pail and trigger it. Increase the Premier pump air regulator (C) pressure as needed to dispense material.

9. Release the gun trigger after all air and/or solvent is purged out of the system and mixed material flows from the gun nozzle.

10. Repeat steps 8 and 9 for each gun connected to the proportioner.

11. Adjust the Premier pump air regulator (C) for the required spraying pressure.

12. The system is ready for spraying.
5. Press the solvent pump key (SK). With the gun triggered, turn the solvent pump air regulator pressure (D) up until the solvent pump is running slowly.

6. Flush the material out of the mix manifold, hoses, and spray gun(s).
   a. Ground the spray gun to a grounded metal pail.
   b. With the gun triggered, open one solvent valve (17b) for about 10 - 15 seconds, close the valve, then open the other solvent valve for 10 - 15 seconds. Alternate opening and closing the valves until the solvent pump stops.
   c. If the lines are not clean, press the solvent pump key (SK) again and repeat steps 6a - 6b.
   d. Repeat steps 6a - 6c for each gun connected to the proportioner.

7. Close both solvent valves (17b).

8. Follow the Pressure Relief Procedure in General Operation.
1. Follow the Pressure Relief Procedure in General Operation.
2. Set the system regulators and valves.
   **Regulators:**
   - Premier Pump
   - Solvent Pump
   - Feed Pump A
   - Feed Pump B
   **Valves:**
   - Fluid Drain Valves
   - Mix Manifold Valves
   - Solvent Valves
   - Recirculation Valves
   - Solvent Supply Valves
   - Fluid Flow Control Valves
   - Flow Direction Valves: Flow to reservoir.
3. Set the mode key (MK) to Spray Mode.
4. Turn up the Premier pump air regulator (C) pressure gradually until the pump is running slowly.
5. If heaters are used, turn heaters on to the desired settings. Recirculate material until the desired reservoir temperature is reached.
1. Follow the Pressure Relief Procedure in General Operation, then remove the gun tip guard, spray tip and gasket. Clean the parts.

2. Follow the Daily Shutdown/Mixed Material Flush procedure.

3. Unload the reservoirs.
   a. Set the mode key (MK) to Manual Mode.
   b. Set the system regulators and valves.
   - Regulators:
     - Premier Pump 0 Air Pressure
     - Solvent Pump 0 Air Pressure
     - Feed Pump A 0 Air Pressure
     - Feed Pump B 0 Air Pressure
   - Valves:
     - Fluid Drain Valves
     - Mix Manifold Valves
     - Solvent Valves
     - Recirculation Valves
     - Solvent Supply Valves
     - Fluid Flow Control Valves
     - Flow Direction Valves: Flow to reservoir.
   c. Make sure the reservoir outlet valves are open.
   d. Hold down the Premier pump key (PK) and turn up the pump air regulator (C) pressure until the pump is running slowly.
   e. Operate the Premier pump until the reservoirs have emptied through the drain valve (204).

4. Close the fluid drain valves (204).

5. Open the solvent supply valves (223).

6. Fill the reservoirs with solvent.
   a. Press the solvent pump key (SK) again if necessary. Monitor the fill cycle to avoid overflow. Press solvent key to stop pump.

7. Check the amount of solvent in the reservoir.
   a. Make sure there is enough solvent to flush the system. Press the solvent pump key (SK) again if necessary. Monitor the fill cycle.
   b. Clean the inside of the reservoir with a soft brush.

8. Operate the agitator (53) to clean the shaft and mixer blade.
9. Circulate solvent through the recirculation valves.
   a. Close solvent supply ball valves (223).
   b. Open the recirculation valves (230).
   c. Hold down the Premier pump key (PK) and turn up the Premier pump air regulator (C) pressure gradually until the pump is running slowly.
   d. Operate the Premier pump for about a minute.
11. Open the fluid drain valves (204).
12. Operate the Premier pump to completely drain solvent out of the system through the drain valves (204).
13. Repeat steps 5-12 until the solvent flowing out of the fluid drain valves (204) looks clean.
14. Close the fluid drain valves (204).
15. Flush the material out of the mix manifold, hoses, and spray gun(s).
   a. Open the mix manifold valves (17a).
   b. Hold down the Premier pump key (PK).
   c. Ground the spray gun to a grounded metal pail and trigger the gun until the solvent flowing out of the gun looks clean, then release the gun trigger and the Premier pump key.
   d. Repeat steps 15a-15c for each gun connected to the proportioner.
16. Close the mix manifold valves (17a).
17. Open the fluid drain valves (204) and operate the Premier pump until the reservoirs are empty.
18. Follow the Pressure Relief Procedure in General Operations.
19. Close the reservoir valves (56).
20. Remove and clean the reservoir filters (54) and the fluid outlet filters (202).
NOTE: For this procedure, the side of the system being color change flushed is referred to as A and the other side as B. The actual side you need to flush may be different than what is shown in the diagram.

1. Follow the Mixed Material Flush procedure to prevent material from hardening in the hose(s) and gun(s).
2. Set the mode key (MK) to Manual Mode.
3. Set the system regulators and valves.
4. Hold down the Premier pump key (PK) and turn up the Premier pump air regulator (C) pressure gradually until the pump is running slowly. Operate the Premier pump until the material being changed (A side) is purged from the system.
5. Close the A side fluid drain valve (204).
7. Open the A side fluid flow control valve (226).
8. Open the A side solvent supply ball valve (223).
9. Press the solvent pump key (SK). Turn the solvent pump air regulator pressure (D) up until the solvent pump is running slowly.
10. Operate the solvent pump until there is enough solvent in the reservoir to flush the A side fluid lines. Monitor the fill cycle to avoid overflow.
11. Close the A side solvent supply ball valve (223).
12. Open the recirculation valves (230) to recirculate the solvent and clean the valves.
13. Clean the A side reservoir and reservoir filter while the solvent recirculates.
   a. Remove buildup inside the reservoir with a soft brush or a putty knife.
   b. Remove the solids from the reservoir.
   c. Close the A side reservoir ball valve (56).
   d. Remove and clean the reservoir filter (54).
14. After the material is completely dissolved by solvent, repeat steps 3 to 9.
15. If the solvent has not cleaned the material sufficiently, reload the reservoir with fresh solvent, recirculate the solvent, and repeat steps 3 to 9.
16. Fill the reservoir on the color change side with new material.
17. Adjust the agitator air control valve to agitate the material in the reservoirs.

18. Load the system with new material.
   a. Set the system valves as instructed in step 3.
   b. Operate the Premier pump until the new material flows steadily from the A side fluid drain valve (204).
   c. Close the fluid drain valve (204).
   d. Close the recirculation valves (230).
19. Open the mix manifold valves (17a).
20. Set the mode key (MK) to Spray Mode.
21. Load the new material out to the spray gun(s).
   a. Ground the gun to a grounded metal pail and trigger it. Increase the Premier pump air regulator (C) pressure as needed to dispense material.
   b. Trigger the gun until the new material flows steadily from the spray gun.
   c. Repeat steps 21a and 21b for each gun connected to the proportioner.
22. Adjust the Premier pump air regulator (C) for the required spraying pressure.
23. The system is ready for spraying.
1. Prime the system with material.

2. Set the mode key (MK) to Manual Mode.

3. Set the system regulators and valves.

   Regulators:
   - Premier Pump C 0 Air Pressure
   - Solvent Pump D 0 Air Pressure
   - Feed Pump A E 0 Air Pressure
   - Feed Pump B F 0 Air Pressure

   Valves:
   - Fluid Drain Valves 204 Close
   - Mix Manifold Valves 17a Close
   - Solvent Valves 17b Close
   - Solvent Supply Valves 223 Close
   - Recirculation Valves 230 Open
   - Fluid Flow Control Valves 226 Open
   - Flow Direction Valves: Flow to reservoir 238 Open

4. Set the mode key (MK) to Spray Mode.

5. Recirculate the material by turning up the Premier pump air regulator (C) pressure gradually until the pump is running slowly.

6. Balance the proportioning pumps’ fluid pressures.
   a. Read the fluid pressure gauges (207).
   b. Adjust the fluid flow control valves (226) until the pump pressures are balanced. Set pressure close to actual spraying pressure to be used.

7. Set the mode key (MK) to Manual Mode.

8. Turn the flow direction valves (238) so the arrow points down, to allow fluid to go to the beakers (228).

9. Make sure the ratio check tubes (240) are in the beakers (228) and do not over-pressurize the Premier pump. Wear safety glasses.

10. Press the Premier pump key (PK) and run the pump for 3 cycles (6 strokes).

12. Compare the volume of the beakers.

   If the ratio is not correct, repeat steps 6-11. If the ratio is incorrect again:
   a. Check the material supply level.
   b. Check the inlet/outlet pressure ratio of the proportioner.
   c. Check for fluid leaks.

13. Flush the valves and ratio check tubes.
   a. Remove the beakers (228) from the cabinet.
   b. Place the ratio check tubes (240) into the waste containers.
   c. Open the solvent supply ball valves (223).
   d. Fully open the fluid flow control valve (226).
   e. Press the solvent pump key (SK). Operate the solvent pump until the valves and lines are clean.
   f. Close the solvent supply ball valves (223).

14. Follow the Pressure Relief Procedure in General Operation.
Alarms

NOTE: See Manual 308803 or 308925 for more detailed component troubleshooting information.

Follow the Pressure Relief Procedure before checking or servicing system components.

Alarm Display Key
The alarm (red) lights are shown in the alarm displays as

Reservoir Low Level Sensor Alarm
NOTE: Setup selection of the fluid level sensors in the low level position is the standard configuration. This alarm occurs in spray mode only.

Alarm Corrective Action

<table>
<thead>
<tr>
<th>Cause</th>
<th>Solution</th>
</tr>
</thead>
<tbody>

<td>7</td>
<td>Software revision</td>
<td>Future†</td>
</tr>
</tbody>
</table>

#### Select temperaturesensor option

1 = temperature sensor 2 = no temperature sensor

### Select level sensor option

1 = low level sensors, with no feed pumps 2 = high level sensors, with feed pumps 3 = both sensors, with feed pumps 4 = both sensors, with feed pumps

### Select pressure option

1 = pressure | °F 2 = MPa/°C 3 = bar/°C

### Select unit of measurement

1 = psi/gallon, °F 2 = MPa/liter, °C 3 = bar/liter, °C

### Work life time

Set minimum allowable pressure option 1 = deactivate sensors 2 = low level sensors, with no feed pumps 3 = high level sensors, with feed pumps 4 = both sensors, with feed pumps

### Temperatures limit for either reservoir

Low temperature limit for A or B component reservoir

### Work life time remaining

Set material work life time. Set time to 0 to deactivate work life timer.

### Future†

Not implemented in this software version.
